WS2818

Single-line 256 Gray-level 3-channal Constant Current LED Driver IC

Features

- 5V/24V available, that work on different applications of stable pressure.
- Built-in 24V voltage regulator tube, only add a resistance to IC VDD pin when the voltage is below 24V.
- Adopts the built-in signal reshaping circuit to achieve the signal waveform shaping, and thus no signal waveform distortion takes place.
- Built-in power-on reset and brown-out reset circuits.
- The gray levels of each pixel of 256 levels, and the refresh frequency reaches to 2KHz/s.
- Serial cascading interface, data receiving and decoding are all achieved by one signal line.
- Signal Break-point Continuous Transmission, any pixel's failure, it won't affect the whole display effect.
- The distance of any two signal transmission points is less than 5 meters, there's no extra circuits needed.
- When the refresh rate of 30fps, the cascade number are not less than 1024 pixels.
- Send data at speeds of 800Kbps.
- Good consistency reliability, high cost-effective.

Applications

- Guardrail tube series, point light display series, flexible/rigid strips series, module series applications.
- Lighting stage costumes, innovative gadgets or any other electronic products.

General description

WS2818 is a 3-channel LED driver control circuit, its internal include intelligent digital port data latch and signal reshaping amplification drive circuit. Also include a precision internal oscillator and a 12V voltage programmable constant current control part, which achieves highly consistent color effect.

WS2818 has strong features in Signal Break-point Continuous Transmission, it adopts dual signal transmission, these signals are able to work together without interaction. The user can select the first chip DIN/BIN as the control signal input pin, and the follow-up cascade chips will automatically identify the output signal released by the first chip which not to affect the whole display effect.

WS2818 adopts Single-line Return-to-Zero communication protocol. After the chip gets power-on reset, the DIN port receive data from controller, the first chip collects initial 24bit data then sent to the internal data latch, the other data which reshaping by the internal signal reshaping amplification circuit sent to the next cascade pixel through the DO port. The data reduced 24bit after transmitted through every pixel. Since WS2818 adopts auto-reshaping transmit technology, making the pixel cascade numbers are not limited to the signal transmission, but to signal transmission speed. When BIN works as control signal receiving interface, its control data is 24bit more than the DIN interface, so as to ensure that the two ways to control the number of pixels is the same

Based on the received 24bit data, the internal data latch generates different duty cycle control signals in the OUTR, OUTG, OUTB port. All chips synchronous send the received data to each segment when the DIN port input a reset signal. It will receive new data again After the reset signal finished. Before a new reset signal received, the control signal of OUTR, OUTG, OUTB pin unchanged. The chip exports PWM data to OUTR, OUTG, OUTB pins, after receive a low voltage reset signal the time retain over 300us.

SOP8 and MSOP8 packaging available for sale.

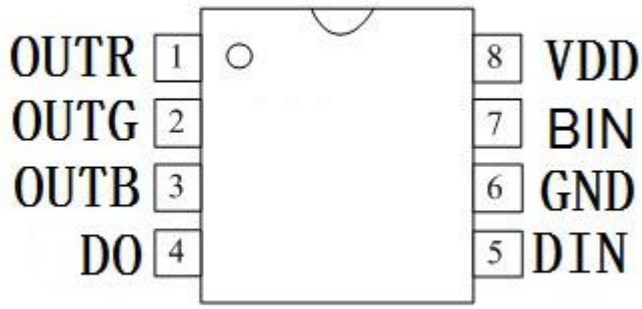
PIN configuration



PIN Function

NO.	Symbol	PIN	Function description
1	OUTR	LED Driver Output	Output of Red PWM control
2	OUTG	LED Driver Output	Output of Green PWM control
3	OUTB	LED Driver Output	Output of Blue PWM control
4	DO	Data Output	Data cascade output
5	DIN	Data Input	Control data input
6	GND	Ground	Data & Power Grounding
7	BIN	Backup Data Input	Backup control data input
8	VDD	Power Voltage	IC power supply

Absolute Maximum Ratings (T_A=25℃, V_{SS}=0V, unless otherwise noted.)

Parameter	Symbol	Ratings	Unit
Power Supply Voltage	V_{DD}	+3.0~+5.3	V
Input Voltage	V_I	-0.5～VDD+0.5	V
Operation Temperature	Topt	-25～+85	℃
Storage Temperature Range	Tstg	-55~+150	℃
R/G/B Channel Over-voltage Withstand (5V)	Vout	7	V
R/G/B Channel Over-voltage Withstand (24V)	Vout	28	V

Electrical Characteristics（TA=-20～+70℃, VDD=4.5～5.5V, VSS=0V unless otherwise noted.）

Parameter	Symbol	Min.	Tpy	Max.	Unit	Conditions
Low voltage output current	I_{OL}	17.5	18.5	19.5	mA	
	I_{dout}	10	——	——	mA	Vo=0.4V，D_{OUT}
Input current	I_I	——	——	±1	μA	$V_I=V_{DD}/V_{SS}$
High-level Input	V_{IH}	$0.7V_{DD}$	——	——	V	D_{IN}
Low-level Input	V_{IL}	——	——	$0.3\ V_{DD}$	V	D_{IN}
Hysteresis Voltage	V_H	——	0.35	——	V	D_{IN}

Switching Characteristics（TA=-20～+70℃, VDD=4.5～5.5V, VSS=0V, unless otherwise noted.）

Parameter	Symbol	Min.	Tpy	Max.	Unit	Conditions
Transmission Delay Time	t_{PLZ}	——	——	300	ns	CL=15pF,DIN→DOUT,RL=10KΩ
Fall Time	t_{THZ}	——	——	120	μs	CL=300pF,OUTR/OUTG/OUTB
Data Transmission Rate	F_{MAX}	400	——	——	Kbps	Duty Ratio 50%
Input-capacitance	C_I	——	——	15	pF	——

Sequence Time

T0H	0-code, High-level time	220ns~480ns
T1H	1-code, High-level time	750ns~2μs
T0L	0-code, Low-level time	750ns~2μs
T1L	1-code, Low-level time	220ns~480ns
RES	Frame unit, Low-level time	300μs or more
